

JanSahayak User Flow Report

User-flow design for WhatsApp, SMS, web, and IVR channels

Team Members • Vansh Dhiman 23115154 • Shashank Saha 23115133 • Shivansh Kanodiya 23115137 • Prince Peelwa 23115112 • Satyam Singh 23115165			
Core flow Language choice + 5 simple answers before shortlist.	Channels Web, WhatsApp, SMS, and IVR-friendly conversation.	Personas Farmer household, gig worker, and woman head of household.	Fallback SMS/IVR plus local CSC/Panchayat handoff when data is unavailable.
Report standard: This document keeps the project grounded in the uploaded deliverable content, with clearer formatting, stronger flow, and a safer implementation narrative. It avoids claiming real field results unless they are actually collected.

Low-Friction Channel Choice

For a user with a Rs 500 keypad phone, SMS and IVR are the safest fallbacks because they do not require mobile data or app literacy. WhatsApp is better when a shared family smartphone is available because it supports longer text, document links, and language rendering. The project therefore supports all three:

- SMS: short text responses, no media dependency.
- IVR: voice-first flow for low literacy.
- WhatsApp: richer checklist delivery when data is available.

Offline Fallback

If the user has no data balance:

- Use SMS keyword flow through `/webhook/sms`.
- Use IVR through `/webhook/ivr`.
- Send a compact checklist that can be shown to a CSC operator, Panchayat secretary, ASHA, Anganwadi worker, bank mitra, or LPG distributor.
- Cache the scheme catalogue locally; no live model call is required for core eligibility.
